<b>Specification</b>		<b>PCE OPALIKA®</b>	
Physical and chemical properties			
<b>1.</b>	<b>Optical properties</b>		
<b>1.1</b>	<b>Refractive index</b> (base glass, annealed at 40 °C/h)	$n_e$	1.525
<b>1.2</b>	<b>Transmittance data</b>		
<b>1.2.1</b>	<b>Spectral transmittance <math>\tau(\lambda)</math></b>		
<b>1.2.1.1</b>	<b><math>\tau(\lambda)</math> - curve</b>		
	Plot of spectral transmittance $\tau(\lambda)$ for ( $\lambda = 300 \text{ nm to } 800 \text{ nm}$ ) $\tau_{VA} = 32 \%$		see annex
<b>1.2.2</b>	<b>Luminous transmittance <math>\tau_v</math></b>		
	The luminous transmittance is dependent on the white layer, the thickness of which varies over the manufacturing width and is generally in the order of 0.45 mm + 0.35 mm / - 0.2 mm . At the indicated nominal thickness of the white layer of 0.45 mm the following luminous transmittance $\tau_{VA}$ in % is reached (refer also 6.2).		32 ± 8
<b>2.</b>	<b>Thermal properties</b> (only base glass)		
<b>2.1</b>	<b>Viscosities and corresponding temperatures</b>		
	Softening point in °C ( $\eta = 10^{7.6} \text{ dPas}$ )		<b>719</b> (~1326 °F)
<b>2.2</b>	<b>Transformation temperature <math>T_g</math> in °C</b>		<b>533</b> (~991 °F)
<b>2.3</b>	<b>Coefficient of thermal expansion <math>\alpha</math></b>		
<b>2.3.1</b>	<b>Coefficient of mean linear thermal expansion</b> $\alpha(20 \text{ °C}; 300 \text{ °C})$ in $10^{-6} \text{ K}^{-1}$ (static measurement)		9.4

<b>Specification</b>		<b>PCE OPALIKA®</b>
Physical and chemical properties		
<b>3.</b>	<b>Mechanical properties</b>	
<b>3.1</b>	Density $\rho$ in g/cm <sup>3</sup>	2.6
<b>3.2</b>	Stress optical coefficient <b>C</b> in $1.02 \cdot 10^{-12}$ m <sup>2</sup> /N	2.7
<b>3.3</b>	<b>Breaking strength</b>	
	Admissible value for the bending strength $\sigma_{zul}$ of technically annealed glasses as calculation basis (air) in N/mm <sup>2</sup>	30
	A higher mechanical strength is possible by thermal toughening	
<b>3.3.1</b>	<b>Chemical toughening</b>	disregard
<b>3.3.2</b>	<b>Thermal toughening</b>	
	The different viscosity characteristics of the white flashed layer and the base glass have to be considered and to eventually comply with the requirements of safty glass need to be checked. As a result of this heat treatment, the transmittance may vary whilst at the same time the diffusion indicatrix (refer to 6.1) changes accordingly.	
<b>4.</b>	<b>Chemical properties</b>	
	Because both types of glass do have a different behaviour in resistance of water, acids and alkaline solutions, the usual classification cannot be made. You can say that OPALIKA® is largely insensitive to the action of water, acids, alkalis and salt solutions (with the exception of hydrofluoric acid).	
<b>5.</b>	<b>Electrical properties</b>	disregard

<b>Specification</b>		<b>PCE OPALIKA®</b>
Physical and chemical properties		
<b>6.</b>	<b>Other properties</b>	
<b>6.1</b>	<b>Light diffusion</b>	
	In the visible range of the optical spectrum OPALIKA® gives almost ideal diffusion, i.e. when represented graphically the diffusion depending on angle (diffusion indicatrix) appears nearly as a circle. The remaining proportion of the direct radiation is superimposed and at the zero axis it appears as a "nose" dependent on the wavelength. There is a sharp increase with increasing wavelengths from $\lambda = 800$ nm onwards.	
	Typical diffusion indicatrix (no specified size)	see annex
<b>6.2</b>	<b>Closer tolerances</b>	
	For special requirements in technique of measurement closer tolerances ( $\tau$ and $d_{\text{white flashed layer}}$ respectively) are possible, however, depending on the size of the panel.	
<b>7.</b>	<b>Annex (diagrams, curves)</b>
